Brainstorming & Idea Prioritization

Treavue — Personalized Travel Itinerary Planner

Project documentation prepared for portfolio and repository use

Project

Treavue — Personalized Travel Itinerary Planner

Problem

Trip planning often requires users to combine destination research, dates, budgets, interests, transport choices, and daily activity scheduling across multiple tools.

Target users

Students, families, couples, solo travelers, and people who want a structured starting point for planning a trip.

Ideas considered

- Destination discovery and details
- Preference-aware itinerary generation
- Budget-aware activity planning
- Saved trips and itinerary editing
- Conversational travel assistance
- Live route optimization and live price aggregation

Prioritization

Feature	User value	Feasibility	Priority
Itinerary generation	**High**	**High**	**P1**
Trip save/edit	**High**	**High**	**P1**
Preference inputs	**High**	**High**	**P1**
Cost estimates	**Medium**	**Medium**	**P2**
Live routes/prices	**High**	**Low without providers**	**Future**

Selected direction

Build an approachable travel planner that generates a structured itinerary from user preferences, supports trip management, and persists trip data through a FastAPI/Supabase integration.

Assumptions and limits

Recommendations and activity costs depend on the data currently available in the project. The application should label estimates clearly and must not imply live verification when none exists.
