Problem Statement Definition

Treavue — Personalized Travel Itinerary Planner

Project documentation prepared for portfolio and repository use

Primary problem statement

Travelers need a simple way to turn their destination, dates, budget, interests, and practical requirements into an organized itinerary without manually coordinating information across many sources.

Who experiences it?

People planning personal trips who want a useful first itinerary and a place to keep editing it.

Current pain points

- Planning information is fragmented across websites and notes.
- Daily activities can be difficult to organize around dates and pace.
- Costs and transport assumptions can be unclear.
- Plans need changes as preferences evolve.

Proposed outcome

A web application that collects trip preferences, creates a day-by-day plan using available destination/activity data, provides transparent estimates, and allows users to save and manage trips.

Success indicators

- A user can submit trip preferences and receive an itinerary.
- A user can review activities and estimated costs where available.
- Trip CRUD operations work in the configured storage environment.
- UI communicates when data is estimated or unavailable.

Out of scope for current version

Guaranteed live prices, live availability, exact route optimization, and secure multi-user ownership until authentication and authorization are fully implemented.
