Solution Requirements

Treavue — Personalized Travel Itinerary Planner

Project documentation prepared for portfolio and repository use

Functional requirements

- Browse destination information available in the project.
- Collect dates, budget, traveler count, interests, pace, transport, dietary/accessibility needs, and must-visit preferences.
- Generate a structured day-by-day itinerary.
- Display activity information and available cost estimates.
- Save, list, retrieve, update, rename, and delete trips through the storage integration.
- Provide clear status and error messages.
- Offer the existing chat interface where configured.

Non-functional requirements

- Responsive and understandable UI.
- Typed frontend code and modular backend routes.
- Input validation and predictable API responses.
- Graceful fallback when cloud storage is unavailable.
- No exposure of backend secrets to frontend builds.
- Clear distinction between estimates and live verified information.

Technical constraints

React, Vite, TypeScript, FastAPI, Python, Supabase. Keep existing chat functionality separate from trip persistence changes.

Known limitations

Live prices, live route times, accommodation availability, and venue-specific accessibility/dietary verification require external verified data and are not guaranteed by static project data.
