Treavue — Personalized Travel Itinerary Planner

Project documentation prepared for portfolio and repository use

Frontend

React, Vite, TypeScript; existing components and styling.

Backend

Python and FastAPI for itinerary generation and REST endpoints.

Database / persistence

Supabase PostgreSQL; public.trips table stores trip metadata plus full trip_data in JSONB.

Client-side fallback

Browser localStorage keeps locally available app state and helps preserve trip data when cloud persistence is unavailable.

Testing

pytest and FastAPI TestClient for backend tests; frontend TypeScript typecheck and production build.

Development tools

VS Code, PowerShell, Git/GitHub, browser dev tools, Supabase Dashboard.

Secrets and deployment

Backend-only Supabase secret settings must remain server-side. Authentication, per-user ownership, and RLS need end-to-end verification before public deployment.
