Problem–Solution Fit

Treavue — Personalized Travel Itinerary Planner

Project documentation prepared for portfolio and repository use

Problem

Travel planning is fragmented and time-consuming, especially when balancing personal interests, schedule, and budget.

Solution

Treavue consolidates preference collection, itinerary generation, trip organization, and persistent storage into one web application.

Value proposition

A useful, editable starting itinerary that reflects the user's stated preferences and keeps trip information organized.

Fit rationale

- Preference inputs capture more than just destination.
- Day-by-day itinerary reduces manual scheduling effort.
- Trip management allows iteration.
- Transparent estimate and route caveats avoid overpromising.

Validation plan

- Test with varied budgets and interests.
- Check whether generated days reflect pace preferences.
- Verify CRUD round-trips against Supabase.
- Collect feedback on clarity, usefulness, and missing information.

Risks

Static data can limit recommendation quality; persistent storage without verified user ownership is not production-secure.
