Proposed Solution

Treavue — Personalized Travel Itinerary Planner

Project documentation prepared for portfolio and repository use

Overview

Treavue is a web-based personalized travel itinerary planner designed to help users organize a trip from initial preferences through a structured daily plan.

Core workflow

- Explore destination information.
- Enter travel dates, traveler details, budget, interests, pace, transport, dietary/accessibility requirements, and must-visit places.
- Generate an itinerary from available destination/activity data.
- Review day plans, activity details, and available estimated costs.
- Save and revise the trip.

Persistence

A FastAPI trip API integrates with Supabase PostgreSQL. The full trip object is retained as JSONB alongside searchable metadata. Browser storage acts as a fallback when sync is unavailable.

Personalization

The current generator can rank available schedule choices against interests, must-visit requests, pace, and budget guidance, subject to available data.

Honest boundaries

The project does not guarantee live price data, exact travel times, live availability, or venue suitability. These require independent verification or future integrations.
