Code Layout, Readability and Reusability

Treavue — Personalized Travel Itinerary Planner

Project documentation prepared for portfolio and repository use

Repository structure

Path	Responsibility
artifacts/treavue/src/	**React frontend, pages, components, API client, types, local storage**
backend/app/api/routes/	**FastAPI endpoint modules**
backend/app/core/	**Backend configuration and Supabase client**
backend/app/schemas/	**Validated request/response data shapes**
backend/app/data/	**Existing destination/activity data**
backend/tests/	**Backend automated tests**
backend/.env.example	**Names of backend environment variables; blank placeholders only**

Readability practices

- Keep route handlers focused on HTTP/API behavior.
- Use schemas and typed frontend interfaces consistently.
- Keep persistence logic behind API functions.
- Show useful user-facing errors without leaking secrets.
- Keep secrets out of source code and frontend VITE variables.

Reusability

Shared trip types, centralized API helpers, reusable UI components, and isolated backend route modules reduce duplication.

Maintenance notes

Review API contracts when changing trip fields; ensure JSONB serialization remains compatible; test migration and fallback behavior after changes.
