Scalability and Future Plan

Treavue — Personalized Travel Itinerary Planner

Project documentation prepared for portfolio and repository use

Current foundation

Separated React frontend, FastAPI endpoints, and Supabase trip persistence provide a modular base for future improvements.

Priority 1 — Security

Implement and verify Supabase Auth, access-token validation, owner-derived authorization, RLS, and cross-user access denial. Do not deploy publicly until complete.

Priority 2 — Reliable travel data

Integrate trusted data sources for opening hours, prices, transport, and availability only after evaluating licensing, reliability, and cost.

Priority 3 — Routing

Use a verified routing provider for distances and travel-time estimates; label provider and timestamp.

Priority 4 — Personalization

Improve preference ranking using feedback and better-curated destination/activity metadata.

Priority 5 — Quality

Add end-to-end tests, load testing, observability, error reporting, and accessibility checks.

Scaling considerations

Add pagination for larger trip collections, monitor API latency, apply rate limits, and review database indexes and retention policies.
